ABSTRACT OF THE DISCLOSURE

A system and method communicate information from a single-threaded application over multiple I/O busses to a computing subsystem for processing. In accordance with one embodiment, a method is provided that partitions state-

5 sequenced information for communication to a computer subsystem, communicates the partitioned information to the subsystem over a plurality of input/output busses, and separately processes the information received over each of the plurality of input/output busses, without first se-sequencing the information.
